

ABSTRACT

A pair of hairdressing scissors can easily accommodate the hands and fingers of each user such as the thickness and length by bending the finger grip to a desired size and shape. Further, the hairdressing scissors has minimum limitations when changing the size of the finger grip. The hairdressing scissors do not cause discomfort to the fingers in the finger grips. The hairdressing scissors 1 include two shear bodies 2 joined together each having a blade 3 is on a front end A and a finger grip 4 on a back end B. The finger grip 4 is provided with a slit 6 and is configured by a shape and material that enable plastic deformation to be widened or narrowed. Both end portions 7 of the slit 6 are formed so that a side surface of each end portion passes one another.
